

Experts on the Integration of Revit into your ERP System

entegra Revit Data Connector

Do you work with Autodesk Revit, use an ERP system, and want to optimize your processes?

The implementation of a powerful interface between planning and material management can be a valuable element in the optimization of your processes.

We have the product, the expertise, and the experience to guide you through this process as your expert and reliable partner.

entegra Revit Data Connector

With the entegra Revit Data Connector, you can integrate Revit into your ERP system – in the shortest possible time at manageable and clearly calculable costs.

Product instead of customizing

The Revit Data Connector ERP is a standard product and is continuously developed and adapted to new Revit versions as part of the software maintenance.

Return on investment

Supported by our ROI calculator, we have already compared costs and benefits with many customers.

With a clear business assessment, you will receive a transparent basis of decision-making for your investment in an Inventor ERP interface.

Maintenance of parameters for Revit families and product catalogs

For the first time, Revit families and product catalogs can be equipped with metadata or parameter values can be updated on existing families, or variants can be generated, e.g., in a foreign language. The metadata can be taken from your ERP system.

Planning with articles and bills of materials

The use of Revit in an article-based planning process entails tasks that are not covered by Revit Standard. These tasks include, for example, comparison of article data with the ERP system, the generation of item numbers, and the determination of weights, as well as the generation of a complete bill of materials and handover to an ERP or other third-party system.

Experience

Put your trust in a systems trader with expertise. We have already implemented integrations on the following systems with our interfaces:

abas ERP, AvERP, avista.ERP, canias ERP, eEvolution, IFS Applications, infor, Isah ERP, proALPHA, PSIpenta, Microsoft Dynamics NAV, sage, SAP Business One, SAP ERP, SAP R/3, SIVAS.ERP and SYSPRO, as well as company-specific ERP systems.
