

Updating Inventor Resources

entegra Vault Drawing Updates

Updating legacy Inventor data pools can be a major challenge. In addition to the technical work itself, another issue is that there is usually no time available for such tasks in day-to-day business.

Tasks

Automatically update Inventor drawing derivations after a system change (e.g., from Productstream Professional to Autodesk Vault) or when company standards change (e.g., new logo, etc.).

Scope of services

With the drawing update product, we expand Autodesk Vault with the ability to update drawing resources from Inventor drawing derivations.

The “classic” drawing resources such as borders, title blocks and sketch symbols can be supplemented or updated from a template file. In addition, the styles from the global styles of the style library can be updated and a revision table can be inserted.

Client version

In the client version, you process the desired files via the context menu for marked files directly in the Vault Client – the processing is performed at your workstation.

Server version

The server version utilizes the Vault Job Server – processing is performed centrally on a dedicated computer. This frees up the CAD workstation and enables both automated processing and command triggering from non-CAD workstations.

Advantages and benefits

With automated processing, companies benefit from uniform standards and drawing derivations that function correctly. Particularly after system changes (e.g., Productstream Professional to Vault), the proper function of drawing resources is not ensured, e.g., revision tables are no longer filled out automatically. With the drawing update, you can reset to the necessary Inventor standard.

The program-based processing saves valuable time and offers a consistently reliable result.
